

Astraea Workspace

A sovereign work and information system - not 14 isolated apps, but one shared semantic workspace.

THE SOVEREIGN PERSONAL OFFICE + ENTERPRISE WORKSPACE

Local First | Encrypted by Default | Zero Telemetry | No Account Required

Open-Core Beta 0.1 - public review and independent audits are explicitly encouraged.

The short version

Astraea Workspace organizes work around shared objects, shared rules and shared security - not app silos.

A workspace where the work itself is the primary object - not the app that happens to display it.

What that means in practice

- Writer, Grid, Present, Notes, PDF Studio, Tasks, Whiteboard and Vault form the free Open-Core Personal Office.
- Projects, Planner, Database, Forms, Spaces and GaiaCom Bridge extend the same core with enterprise governance, data processes and collaboration.
- WOM and Workspace Fabric keep identities and references stable across app boundaries. Copy and Live Reference are deliberately different operations.
- Tasks, Planner and Projects operate on the same canonical Work Items - there is no second task truth just because the view changes.
- Local-first is the default. Network access, collaboration and external transport paths are explicitly controlled rather than assumed.

One platform, multiple ways of working

The 14 applications are interfaces on shared core services. Data, work and permissions can therefore flow consistently between them.

14 applications

Writer · Grid · Present · Notes · PDF · Tasks · Planner · Projects · Whiteboard · Forms · Database · Vault · Spaces · GaiaCom

WOM + Workspace Fabric

Typed objects · stable IDs · Live/Frozen links · dependency graph · permission provenance

Operations + Versioning

Undo/Redo · atomic groups · cross-document transactions · autosave · recovery

Security + Policy

KeyVault · Crypto Core · NetGate · Policy Engine · Import/Export Sandbox · Diagnostics

VWC + SyncGraph

encrypted native containers · integrity · local persistence · optional E2EE synchronization

Open-Core (Free)

The Sovereign Personal Office - eight full personal work surfaces on the same workspace core.

1

Astraea Writer

.vdoc

Full word processing, structured documents, reports and live references.

2

Astraea Grid

.vgrid

Spreadsheets, formulas, analytics, pivots/charts and computable workspace data.

3

Astraea Present

.vpresent

Vector presentations, masters, animations and live embedded data.

4

Astraea Notes

.vnote

Zettelkasten, Markdown, backlinks, knowledge capture and handoff into other working modes.

5

Astraea PDF Studio

.vpdf

Read, annotate, organize and edit PDFs, then turn review work back into tasks.

6

Astraea Tasks

.vtask

Personal task truth with stable IDs, subtasks, recurrence and workspace links.

7

Astraea Whiteboard

.vboard

Infinite canvas for ideas, workshops, diagrams and workspace objects.

8

Astraea Vault

.vvault

Local encrypted vault for files, versions, integrity, recovery and backups.

Premium / Pro

Enterprise Governance, Data & Collaboration - six additional modules that extend the same semantic core into teams, data and enterprise work.

9

Astraea Projects`.vproj`

Professional schedule, resource, cost and baseline planning with Gantt and Critical Path.

10

Astraea Planner`.vplan`

Team Kanban, WIP, sprints, calendar and workload - as projections of canonical tasks.

11

Astraea Database`.vdb`

Relational local data with schemas, relationships, queries and workspace references.

12

Astraea Forms`.vform`

Forms, surveys and intake processes that can trigger structured follow-up actions.

13

Astraea Spaces`.vspace`

Team and project spaces with roles, dashboards, pages and referenced workspace objects.

14

GaiaCom Bridge`.vgcom`

E2EE exchange of documents, Live Objects, Spaces, reviews and Work Items across verifiable devices/identities.

The shared core

The real differentiation lies less in individual features than in the invariants every app shares.

WOM

Stable IDs, typed schemas, versioning, migration, references and a shared Work Item model.

Fabric

Live/Frozen links, Open Source, Refresh, Freeze, Break/Relink, status, cycle detection and cross-app rendering.

Operations

Every edit as an operation; grouped transactions and atomic cross-document changes.

VWC

Authenticated encrypted containers, journaling/recovery, resource ceilings and no plaintext temp file as a design goal.

Policy

Explicit capabilities, default-deny for undeclared network access, per-app/document rules and auditable decisions.

Interop

OOXML/ODF/PDF/CSV/JSON as adapters - foreign formats are not the internal primary model.

One Work Item, three views

Tasks, Planner and Projects are not three stores for the same task. They are different projections of the same domain truth.

Why this matters

- Status, assignee, due date and progress do not have to be synchronized between three tools.
- A change can happen in the most suitable interface without creating a new shadow copy.
- Cross-app operations can be treated as one transaction and rolled back together.

From thought to outcome

Astraea Workspace covers the lifecycle from an unstructured idea through structured data and work to analysis, communication and archiving.

Example: one intake process

- A form collects a request and validates the input.
- Database keeps the structured domain truth.
- A canonical Work Item is created from it - visible in Tasks, Planner and Projects.
- Grid calculates KPIs; Writer creates the report; Present shows the current state.
- PDF review can create new tasks; Vault versions and secures; GaiaCom deliberately transports Frozen or Live.

Live Objects instead of hidden copies

Workspace Fabric deliberately distinguishes copying from referencing. The goal: fewer data islands, clearer provenance and controllable permissions.

- Stable source/object IDs and version awareness instead of unnoticed snapshot copies.
- States such as current, changed, broken, unavailable, permission-lost or frozen are modeled explicitly.
- Dependency graph and cycle detection prevent uncontrolled reference loops.
- Permission provenance and security downgrade protection follow the object across app boundaries.

Local-first and sovereign data control

Astraea Workspace treats offline work as the normal case, not an emergency mode. External connectivity is an explicit capability.

Sovereignty principles

- No Account Required as a platform doctrine.
- Zero Telemetry by design; local diagnostics instead of automatic upload.
- Native workspace files are encrypted and locally controllable.
- Explicit import/export boundaries; foreign formats are adapters.
- NetGate: declared destinations and purposes instead of ambient network authority.

What it does not claim

- Not an OS-wide firewall replacement unless real OS firewall integration exists.
- No promise of perfect Office or ODF fidelity in the beta.
- No automatic claim of hardware-backed keys without an appropriate provider.
- No independent security certificate merely because internal gates passed.

SOVEREIGNTY = CONTROL + TRANSPARENCY + EXIT

Security by Design

Security is a platform invariant: storage, keys, import, network, recovery, updates and diagnostics use shared controlled boundaries.

VWC

Authenticated encrypted native container

KeyVault

OS-native secure storage + separated security domains

NetGate

Default deny for undeclared egress capabilities

Sandbox

Hostile imports, resource limits, isolated parser paths

Release

Signed artifacts/manifests, hashes, SBOM, rollback protection

Diagnostics

Local-only default, redaction, explicit opt-in

VGT Top Secret: an additional outer security domain

The mode does not replace normal VWC encryption. It seals already authenticated VWC ciphertext again inside a separate pinned Infinity-based envelope.

Documented properties of the profile

- The outer layer receives only already encrypted VWC bytes - no WOM objects, document titles or app semantics.
- Opening is fail-closed: outer structure and PQ signatures, Infinity unseal, authenticate the inner VWC, only then process WOM.
- The Security Context applies platform-wide; Top Secret documents must not silently receive weaker treatment via Search, Clipboard, Print or helper paths.
- The Infinity composition is documented as Research Cryptography and is intended for independent cryptographic review.

Important: "VGT Top Secret" is not a government classification level, accreditation or certification.

Interoperability without a foreign primary model

Office, ODF, PDF and other formats are inputs and outputs. The internal workspace model stays separate so Astraea can preserve its own semantics and security rules.

- Beta: DOCX/XLSX/PPTX are imported/exported as semantic subsets; perfect foreign-format fidelity is not claimed.
- Importers treat input as potentially hostile: size, recursion, time and memory limits, ZIP/XML protections, and no macro execution by default.
- Unsupported features should be preserved or clearly reported - not disappear silently.

Collaboration without giving up the workspace core

Premium connects team context, roles, Live Objects and E2EE transport without making collaboration the owner of the data.

- Spaces organizes project and team contexts through roles, dashboards, pages and referenced objects.
- GaiaCom distinguishes Full Document, Frozen Snapshot, Live Object Invitation, Space Invite, Review Copy, Task Update and other transfer types.
- Identity and device trust are separate problems: key changes, verification and blocking are made visible.
- SyncGraph separates presence from durable operations and is designed for offline queue, merge, tombstones, revocation and backpressure.

Verification instead of blind trust

The beta launch is meant to expose not only source code, but also the verification paths others can use to build their own tests and reproduce claims.

3334 / 3334

Master plan items audit-marked complete (2026-09-26)

- The number describes internal implementation/audit status - not an independent certification.
- The repository contains extensive test, audit, fuzz, smoke and evidence artifacts so external reviewers can reproduce and extend the checks.
- Security and release documentation explicitly states known limitations instead of hiding them behind marketing claims.
- Native CI, signing/notarization, cross-device qualification and independent reviews remain separate release/assurance gates.

DON'T TRUST THE CLAIMS - TEST THE EVIDENCE

What Astraea Workspace aims to be

Not simply an alternative office suite, but a sovereign platform for personal productivity, structured work, data and collaboration.

Open-Core gives individuals a complete local workplace. Premium extends the same workspace with governance, team flow, data processes and secure collaboration.

The guiding idea in six sentences

- A domain truth should not be duplicated merely because it is displayed in another app.
- Personal work should function without cloud dependency, mandatory accounts or telemetry.
- Data, keys and external connections need explicit, verifiable boundaries.
- Documents, work, knowledge and structured data should live together - not merely next to each other.
- Interop matters, but it is not a reason to shape the internal architecture around foreign formats.
- Open code and reproducible tests should enable independent review.

Astraea Workspace

The Sovereign Personal Office / Enterprise Governance, Data & Collaboration

Beta 0.1 - errors are possible. Public review and independent audits are explicitly part of the release goal.
