

Astraea Workspace Premium

Sovereignty, security & governance for organizations - local control without fragmenting productivity workflows into separate silos.

ENTERPRISE GOVERNANCE, DATA & COLLABORATION

Local First | Encrypted by Default | Zero Telemetry | Explicit Network Capabilities

Premium / Pro Beta - validate with a controlled pilot, technical due diligence and independent review.

Why organizations should take a closer look

Astraea Workspace Premium connects office work, team context, data and secure collaboration on a platform whose starting point is local control.

- Local-first: the ability to work is not tied to a permanently reachable cloud service.
- No Account Required and Zero Telemetry are platform doctrine - not a privacy switch added later.
- Native workspace documents are protected by shared encrypted containers and KeyVault policies.
- NetGate controls declared network capabilities; external connectivity is explicit rather than ambient authority.
- Spaces, roles, Policy Engine and GaiaCom extend personal work with controllable team and governance structures.
- Open-Core lowers the entry barrier: employees can evaluate the personal suite before enterprise features are rolled out.
- Public source code plus test/audit evidence supports technical due diligence and independent review.

One shared security boundary

Instead of letting every app invent its own key, import or network logic, all applications use shared platform services.

Policy / Governance

Policy Engine · Spaces roles · classification · least privilege

Network

NetGate · explicit capabilities · destination/purpose · audit decisions

Secrets

KeyVault · device/PIN/password/recipient domains · fail closed

Storage

VWC · authenticated encryption · atomic replace · integrity/recovery

Import / Release

Sandboxed parsers · resource limits · signed updates · SBOM

Premium governance in the work context

Security becomes more effective when permissions and work context remain attached to the objects - instead of starting only at the file share link.

Astraea Spaces

Owner/Admin/Editor/Commenter/Viewer, inheritance, overrides, access review, activity and team dashboards.

GaiaCom Bridge

E2EE transfers with device trust, fingerprints, key-change warnings and distinct transfer semantics.

Astraea Vault

Versioning, integrity checks, trash/recovery, backups and key policy for local data stores.

Policy + NetGate

Rules at app/document/resource level; external destinations must be declared and verified.

Data flow without breaking security

The relevant control point is not only "is the file encrypted?", but whether Search, Recovery, Export, collaboration and helper functions honor the same security policy.

- Top Secret profile: an additional outer Security Domain around already encrypted VWC; no silent downgrade to Standard.
- Search can exclude protected documents from the index; diagnostics block Top Secret content as a reproduction attachment.
- Clipboard/Print/Export helpers must honor the active Security Context or fail closed.
- This architecture is deliberately stricter than a single "Encrypt File" switch.

Note: VGT Top Secret is not a government classification or certification; independent cryptographic review remains an assurance goal.

What Premium brings together for IT and management

Six Premium modules extend the Open-Core Personal Office without introducing a separate data and security stack.

Projects

Planning, baselines, Critical Path, resources and costs.

Planner

Team flow, WIP, sprints, workload - on canonical tasks.

Database

Relational business data with schema, relationships and secure automations.

Forms

Intake, surveys and validated structured input.

Spaces

Roles, context, dashboards, pages and governance.

GaiaCom

E2EE exchange, device trust and Live/Frozen transfer semantics.

A sensible enterprise pilot

Astraea Workspace Premium is beta software. An enterprise pilot should therefore start with verifiable requirements, not marketing promises.

- 1 Data classes** Which documents/data must remain exclusively local or under your own transport control?
- 2 Interop** Which DOCX/XLSX/PPTX/PDF workflows must already be reliable in the beta?
- 3 Governance** Which roles, policies, approvals and egress destinations must be technically enforced?
- 4 Recovery** Which RTO/RPO, versioning and backup requirements apply?
- 5 Audit** Which tests, SBOMs, build artifacts and independent reviews does your due diligence require?

Why Astraea Workspace Premium may be interesting

For organizations that need productivity and collaboration but do not want to hand full control of data and technical policy to an external cloud stack.

Open-Core creates transparency and a low-friction entry. Premium adds governance, data processes, project control and secure collaboration - on the same core.

- Fewer separate data truths through WOM, Fabric and canonical Work Items.
- Shared security and policy boundaries instead of app-specific special cases.
- Local ability to work and explicit transport paths instead of cloud as a technical prerequisite.
- Public source code and evidence as a basis for your own security and architecture review.
- Beta means: pilot, measure, verify interoperability and operational requirements - do not migrate blindly.
